CLEAN & RECONDITION

Parts and equipment are cleaned and reconditioned thoroughly at MPG facility

4

QUALITY CHECK

Pictures are again taken and a detailed quality check is completed

5

DELIVER

Parts are sent back to customer in an organized, efficient manner

MPG DE-RUSTING SERVICES

Metals Preservation Group offers a full product and service approach for de-rusting all production parts and equipment using Cortec VpCI® technology.

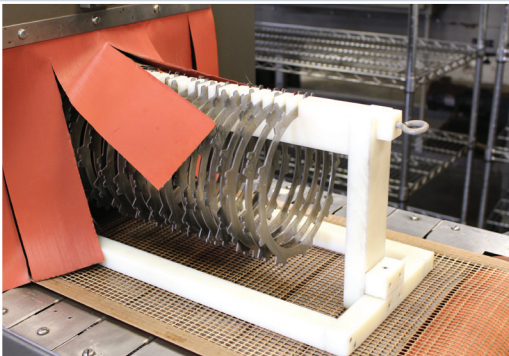

- Our OEM approved de-rusting process has been employed to de-rust millions of production parts including many different types of critical transmission components.
- Bio-based products that are safe for both people and the environment.
- Long lasting, cost-saving solutions provide a time efficient, superior outcome that's gentle yet thorough on your corroded tools, parts and equipment.
- Full service OEM approved process is available at our de-rusting facility. We can customize a solution to your exact specifications.

Custom racks can be designed for high volume parts.

MPG uses an all chemical process. No abrasives are ever used, thereby protecting microfinishes and tolerances.

Parts go through a heat tunnel to eliminate residual moisture and reduce chance for new corrosion.

All parts are hand checked and wiped before going into VCI bags for return to customer.
